Once configured, the IM server can be used with any XMPP/Jabber-enabled client that is capable of configuring connections to the local or corporate servers, including iSymphony and the User Control Panel (UCP).

Current stable and beta versions of the PBX software includes Prosody, a modern, flexible communications server utilizing XMPP/Jabber for instant messaging and chat. The XMPP Pro module allows you to easily set up and configure the Prosody server domain as well as IM and chat users. XMPP (Extensible Messaging and Presence Protocol) is a protocol for instant messaging and presence.
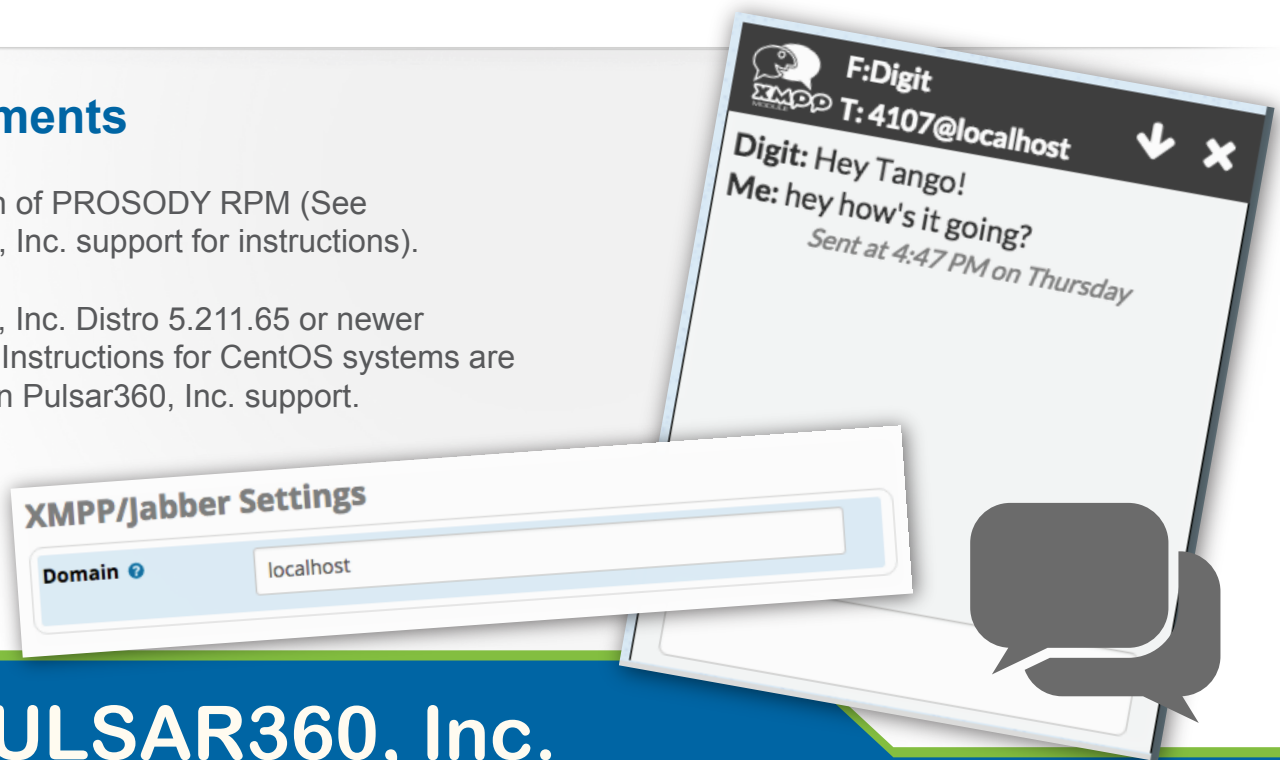

With the XMPP Pro module, you can easily create users directly within the User Management module. You can also control the domain name associated with your local server.

We have added a new XMPP web-based client to the User Control Panel (UCP), which is available in versions 12 and above of the PBX software. With XMPP Pro, you can give your UCP users access to a built-in XMPP chat window.

XMPP/Jabber allows you to use the same account and log in from multiple devices at the same time. For example, you might have an XMPP client at home, one at work, and one on your mobile phone, and all can be connected at the same time.

Requirements

▶ Installation of PROSODY RPM (See Pulsar360, Inc. support for instructions).

▶ Pulsar360, Inc. Distro 5.211.65 or newer preferred. Instructions for CentOS systems are available in Pulsar360, Inc. support.

PULSAR360, Inc.
Listen. Talk. Communicate.
