

# Web Call Back

The Web Callback module allows you to easily add an HTML call-me box to your web site. Visitors enter their phone number into the field in order to be connected with a specific destination. The Web Callback module allows you to prepend information to the caller ID, which can alert you that the call is coming from a specific callback. You can also set dial matches to specify which numbers users are allowed to call. Once you have set your destination and saved changes, you will receive HTML code to paste into your website.

The screenshot displays a configuration interface for a web callback service. It features several input fields and a selection menu, all with a light blue header and a white body. Each field has a question mark icon for help. The fields are: 'Name' (Call Me), 'CID Prepend' (Sales), 'Number Prepend' (empty), 'Dial Matches' (NXXNXXXXXX, 1NXXNXXXXXX), 'Icon' (a row of five 'Click to Call' buttons in different colors: blue, green, red, purple, and grey), 'Valid Message' (Connecting your call...), 'Invalid Message' (Invalid number. Please enter a 10- or 11-digit number.), 'Error Message' (Oops, something went wrong.), 'Destination' (Queues, Support <5000>), and 'HTML Code' (Please save to see the generated code).
